

# Lecture 20 - First-Order Theories

**Vaishnavi Sundararajan**

COL703 - Logic for Computer Science

## Recap: Natural deduction and intuitionistic logic

- Natural deduction proof system for propositional fragment
- More closely mirrors human reasoning, better for automation
- Negation creates complications!
- Easier if we move to a constructive logic: intuitionistic logic
- No law of excluded middle, actually makes proof search easier!
- Can “normalize” proofs; every proof has a normal equivalent
- Normal proofs of  $\Gamma \vdash \varphi$  only mention subformulas of  $\Gamma$  and  $\varphi$
- Yields an algorithm for proof search
- Full FO proof search undecidable; set of subformulas is itself infinite!
- Theorem provers use heuristics to get around this as much as possible

# Formalizations in FOL

- How much of the world can we talk about using FOL?
- Today we will look at some familiar objects described using FOL
- Recall that we could axiomatize groups using FOL
- The following sentences characterize groups.

$$\forall x. [\forall y. [\forall z. [f(f(x, y), z) \equiv f(x, f(y, z))]]] \quad (G1)$$

$$\forall x. [f(x, \varepsilon) \equiv x] \quad (G2)$$

$$\forall x. [\exists y. [f(x, y) \equiv \varepsilon]] \quad (G3)$$

- $\gamma_{\text{grps}} := G1 \wedge G2 \wedge G3$  axiomatizes all groups.
- Any structure  $\mathcal{M} = (M, \iota)$  which is a model for (G1)–(G3) defines a group over  $M$  with group operation  $f$  and identity  $\varepsilon$

# Groups

- In any group, the **cancellation law** holds.
- Consider a group  $G$  with operation  $\circ$ . The cancellation law states that for any  $x, y, z \in G$ , if  $x \circ z = y \circ z$ , then  $x = y$ . Can we state this in FO?

# Groups

- In any group, the **cancellation law** holds.
- Consider a group  $G$  with operation  $\circ$ . The cancellation law states that for any  $x, y, z \in G$ , if  $x \circ z = y \circ z$ , then  $x = y$ . Can we state this in FO?

$$\varphi_c := \forall x. [\forall y. [\forall z. [f(x, z) \equiv f(y, z) \supset x \equiv y]]]$$

- **Exercise:** Show that  $G1, G2, G3 \vdash_{\mathcal{L}} \varphi_c$
- $g \in G$  such that  $g \neq 0$  and  $\underbrace{g \circ g \circ \dots \circ g}_n = 0$  is said to be of order  $n$   
n times
- We will write an interpreted structure as the domain along with the interpreted symbols (here  $\Sigma = (\{\epsilon\}, \{f\}, \emptyset)$  and  $\iota(\epsilon) = 0$  and  $\iota(f) = \circ$ )
- Is there a  $\psi$  such that, if  $(G, \circ, 0) \models \gamma_{\text{grps}}$  and  $(G, \circ, 0) \models \psi$ , then  $(G, \circ, 0)$  is a group with no elements of order 2?

# Groups

- In any group, the **cancellation law** holds.
- Consider a group  $G$  with operation  $\circ$ . The cancellation law states that for any  $x, y, z \in G$ , if  $x \circ z = y \circ z$ , then  $x = y$ . Can we state this in FO?

$$\varphi_c := \forall x. [\forall y. [\forall z. [f(x, z) \equiv f(y, z) \supset x \equiv y]]]$$

- **Exercise:** Show that  $G1, G2, G3 \vdash_{\mathcal{G}} \varphi_c$
- $g \in G$  such that  $g \neq 0$  and  $\underbrace{g \circ g \circ \dots \circ g}_{n \text{ times}} = 0$  is said to be of order  $n$
- We will write an interpreted structure as the domain along with the interpreted symbols (here  $\Sigma = (\{\varepsilon\}, \{f\}, \emptyset)$  and  $\iota(\varepsilon) = 0$  and  $\iota(f) = \circ$ )
- Is there a  $\psi$  such that, if  $(G, \circ, 0) \models \gamma_{\text{grps}}$  and  $(G, \circ, 0) \models \psi$ , then  $(G, \circ, 0)$  is a group with no elements of order 2?

$$\psi := \neg \exists x. [\neg(x \equiv \varepsilon) \wedge f(x, x) \equiv \varepsilon]$$

# Equivalence relations

- An equivalence relation is reflexive, symmetric, and transitive.
- Suppose we have a binary relation symbol  $R \in \mathcal{P}$
- Can force  $R$  to be interpreted as an equivalence relation by ensuring that any structure satisfies the following sentences

# Equivalence relations

- An equivalence relation is reflexive, symmetric, and transitive.
- Suppose we have a binary relation symbol  $R \in \mathcal{P}$
- Can force  $R$  to be interpreted as an equivalence relation by ensuring that any structure satisfies the following sentences

$$\forall x. [R(x, x)] \quad (\text{Eq1})$$

$$\forall x. [\forall y. [R(x, y) \supset R(y, x)]] \quad (\text{Eq2})$$

$$\forall x. [\forall y. [\forall z. [R(x, y) \wedge R(y, z) \supset R(x, z)]]] \quad (\text{Eq3})$$

- $\gamma_{\text{eqrel}} := \text{Eq1} \wedge \text{Eq2} \wedge \text{Eq3}$  characterizes all equivalence relations  $R$ .
- **Exercise:** What if we wanted  $R$  to be interpreted as a congruence?

## Equivalence relations (contd.)

- Let  $\Sigma = \emptyset, \emptyset, \{R/2\}$
- $R$  is an equivalence relation with at least two equivalence classes

## Equivalence relations (contd.)

- Let  $\Sigma = \emptyset, \emptyset, \{R/2\}$
- $R$  is an equivalence relation with at least two equivalence classes

$$\gamma_{\text{eqrel}} \wedge \exists x. [\exists y. [\neg R(x,y)]]$$

- $R$  is an equivalence relation with an equivalence class containing more than one element

## Equivalence relations (contd.)

- Let  $\Sigma = \emptyset, \emptyset, \{R/2\}$
- $R$  is an equivalence relation with at least two equivalence classes

$$\gamma_{\text{eqrel}} \wedge \exists x. [\exists y. [\neg R(x,y)]]$$

- $R$  is an equivalence relation with an equivalence class containing more than one element

$$\gamma_{\text{eqrel}} \wedge \exists x. [\exists y. [\neg(x \equiv y) \wedge R(x,y)]]$$

# Orders

- A **total order** over a set is a binary relation  $<$  (written in infix) which
  - is irreflexive and transitive, and
  - any two distinct elements in the set are related by  $<$
- Can we axiomatize total orders in FOL?

# Orders

- A **total order** over a set is a binary relation  $<$  (written in infix) which
  - is irreflexive and transitive, and
  - any two distinct elements in the set are related by  $<$
- Can we axiomatize total orders in FOL?

$$\forall x. [\neg(x < x)] \quad (\text{TO1})$$

$$\forall x. [\forall y. [\forall z. [x < y \wedge y < z \supset x < z]]] \quad (\text{TO2})$$

$$\forall x. [\forall y. [x < y \vee x \equiv y \vee y < x]] \quad (\text{TO3})$$

- $\gamma_{\text{to}} := \text{TO1} \wedge \text{TO2} \wedge \text{TO3}$  characterizes all total orders.
- **Exercise:** Axiomatize a partial order  $\leq$  (Partial orders are reflexive, antisymmetric, and transitive)

# Fields

- A field is a structure  $(F, \circ, *, 0, 1)$  where  $1 \neq 0$  and
  - $(F, \circ, 0)$  is a group where  $\circ$  is commutative
  - $*$  is an associative commutative operation over  $F$  with identity  $1$
  - every element other than  $0$  has a right-inverse wrt  $*$
  - $*$  distributes over  $\circ$

# Fields

- A field is a structure  $(F, \circ, *, 0, 1)$  where  $1 \neq 0$  and
  - $(F, \circ, 0)$  is a group where  $\circ$  is commutative
  - $*$  is an associative commutative operation over  $F$  with identity  $1$
  - every element other than  $0$  has a right-inverse wrt  $*$
  - $*$  distributes over  $\circ$
- A field is axiomatized by  $\gamma_{\text{flds}} := \gamma_{\text{grps}} \wedge$   
 $\neg(\varepsilon_\circ \equiv \varepsilon_*) \wedge \forall x. [\forall y. [x \circ y \equiv y \circ x]] \wedge \forall x. [\forall y. [x * y \equiv y * x]]$   
 $\forall x. [x * \varepsilon_* \equiv x] \wedge \forall x. [\forall y. [\forall z. [x * (y * z) \equiv (x * y) * z]]]$   
 $\wedge \forall x. [(x \equiv \varepsilon_\circ) \vee \exists y. [x * y \equiv \varepsilon_*]]$   
 $\wedge \forall x. [\forall y. [\forall z. [x * (y \circ z) \equiv (x * y) \circ (x * z)]]]$

# Characterizing sizes of structures

- Recall  $\exists x_1. [\exists x_2. [\dots \exists x_n. [\forall y. [y \equiv x_1 \vee y \equiv x_2 \vee \dots \vee y \equiv x_n]] \dots]]$
- Which structures satisfy this sentence (call it  $\varphi_{\leq n}$ )?
- What about  $\exists x. [\exists y. [\neg(x \equiv y)]]$ ?

# Characterizing sizes of structures

- Recall  $\exists x_1. [\exists x_2. [\dots \exists x_n. [\forall y. [y \equiv x_1 \vee y \equiv x_2 \vee \dots \vee y \equiv x_n]] \dots]]$
- Which structures satisfy this sentence (call it  $\varphi_{\leq n}$ )?
- What about  $\exists x. [\exists y. [\neg(x \equiv y)]]$ ?
- All structures with at least two distinct elements. Call this  $\varphi_{\geq 2}$ .
- Can we write a  $\varphi_{\geq n}$ ?

# Characterizing sizes of structures

- Recall  $\exists x_1. [\exists x_2. [\dots \exists x_n. [\forall y. [y \equiv x_1 \vee y \equiv x_2 \vee \dots \vee y \equiv x_n]] \dots]]$
- Which structures satisfy this sentence (call it  $\varphi_{\leq n}$ )?
- What about  $\exists x. [\exists y. [\neg(x \equiv y)]]$ ?
- All structures with at least two distinct elements. Call this  $\varphi_{\geq 2}$ .
- Can we write a  $\varphi_{\geq n}$ ?
- $\exists x_1. [\exists x_2. [\dots \exists x_n. [\bigwedge_{1 \leq i < j \leq n} \neg(x_i \equiv x_j)] \dots]]$
- What about  $\psi_n = \varphi_{\leq n} \wedge \varphi_{\geq n}$ ?
- **Exercise:** Can one specify an infinite structure?

# Reals

- Consider the structure  $(\mathbb{R}, +, \times, 0)$ , where  $+$  and  $\times$  are interpreted to be addition and multiplication as usual.
- Can we define the relation  $<$  in this structure?
- Is there a formula  $\varphi(x, y)$  such that for all  $a, b \in \mathbb{R}$ ,  $((\mathbb{R}, +, \times, 0), [x \mapsto a, y \mapsto b]) \models \varphi(x, y)$  iff  $a < b$ ?

# Reals

- Consider the structure  $(\mathbb{R}, +, \times, 0)$ , where  $+$  and  $\times$  are interpreted to be addition and multiplication as usual.
- Can we define the relation  $<$  in this structure?
- Is there a formula  $\varphi(x, y)$  such that for all  $a, b \in \mathbb{R}$ ,  
 $((\mathbb{R}, +, \times, 0), [x \mapsto a, y \mapsto b]) \models \varphi(x, y)$  iff  $a < b$ ?
- $\varphi(x, y) := \exists z. [\neg(z \equiv 0) \wedge \exists w. [z \equiv w \times w] \wedge x + z \equiv y]$
- We say that  $<$  is **elementary definable** in this structure
- An  $n$ -ary relation  $R$  is said to be elementary definable in a structure  $\mathcal{M}$  if there is a formula  $\varphi$  with  $n$  parameters such that  
 $\mathcal{M}, [x_1 \mapsto m_1, \dots, x_n \mapsto m_n] \models \varphi(x_1, \dots, x_n)$  iff  $(m_1, \dots, m_n) \in R$ .

## Reals (contd.)

- Consider  $(\mathbb{R}, +, 0)$ . Is  $<$  elementary definable here?

## Reals (contd.)

- Consider  $(\mathbb{R}, +, 0)$ . Is  $<$  elementary definable here? **No**.
- Suppose there exists some  $\varphi(x, y)$  such that  $((\mathbb{R}, +, 0), [x \mapsto a, y \mapsto b]) \models \varphi(x, y)$  iff  $a < b$ . Want a contradiction.
- **Theorem**: If  $\mathcal{M}$  and  $\mathcal{M}'$  are isomorphic  $\Sigma$ -structures, then for all expressions  $\varphi$ ,  $\mathcal{M} \models \varphi$  iff  $\mathcal{M}' \models \varphi$ .
- Aside: Why the same  $\varphi$ ?  $\mathcal{M}$  and  $\mathcal{M}'$  both  $\Sigma$ -structures, and  $\varphi \in \text{FO}_\Sigma$ !
- Suppose there is an isomorphism  $\eta$  from  $\mathcal{M} = (A, \iota)$  to  $\mathcal{M}' = (B, \iota')$ . Then,  $\eta : A \rightarrow B$  and  $\eta^{-1} : B \rightarrow A$  are both structure-preserving.  
$$\left. \begin{array}{l} \eta(f_A(a_1, \dots, a_n)) = f_B(\eta(a_1), \dots, \eta(a_n)) \\ \eta^{-1}(f_B(b_1, \dots, b_n)) = f_A(\eta^{-1}(b_1), \dots, \eta^{-1}(b_n)) \end{array} \right\} f \in \mathcal{F}, \iota(f) = f_A, \iota'(f) = f_B$$
- Similar statements hold for the relation symbols in  $\mathcal{P}$  also.
- One can also show that for every  $\sigma : \mathcal{V} \rightarrow A$ ,  $\eta \circ \sigma : \mathcal{V} \rightarrow B$ , and for every  $\sigma' : \mathcal{V} \rightarrow B$ ,  $\eta^{-1} \circ \sigma' : \mathcal{V} \rightarrow A$ .

## Reals (contd.)

- Suppose there exists some  $\varphi(x, y)$  such that  $((\mathbb{R}, +, 0), [x \mapsto a, y \mapsto b]) \models \varphi(x, y)$  iff  $a < b$ . Want a contradiction.
- If we can demonstrate a structure  $\mathcal{M}'$  isomorphic to  $(\mathbb{R}, +, 0)$  (obtained via some isomorphism  $\eta$ ) and contradict the iff using  $\mathcal{M}'$ , we are done.
- Let  $\eta(r) = -r$ . Is  $\eta$  a structure-preserving isomorphism?

## Reals (contd.)

- Suppose there exists some  $\varphi(x, y)$  such that  $((\mathbb{R}, +, 0), [x \mapsto a, y \mapsto b]) \models \varphi(x, y)$  iff  $a < b$ . Want a contradiction.
- If we can demonstrate a structure  $\mathcal{M}'$  isomorphic to  $(\mathbb{R}, +, 0)$  (obtained via some isomorphism  $\eta$ ) and contradict the iff using  $\mathcal{M}'$ , we are done.
- Let  $\eta(r) = -r$ . Is  $\eta$  a structure-preserving isomorphism? Yes!
  - $\eta(0) = 0$  and  $\eta(a + b) = -(a + b) = (-a) + (-b) = \eta(a) + \eta(b)$
- So  $\eta$  is an isomorphism from  $(\mathbb{R}, +, 0)$  to itself.
- So  $(\mathbb{R}, +, 0), \sigma \models \varphi(a, b)$  iff  $(\mathbb{R}, +, 0), \sigma \models \varphi(-a, -b)$
- $(\mathbb{R}, +, 0), \sigma \models \varphi(a, b)$  iff  $a < b$ , and  $(\mathbb{R}, +, 0), \sigma \models \varphi(-a, -b)$  iff  $-a < -b$ .
- Contradiction! So  $<$  cannot be elementary defined in the theory of reals using  $+$  and  $0$ .
