Lecture 9 - First-order logic

Vaishnavi Sundararajan

COL703/COL7203 - Logic for Computer Science

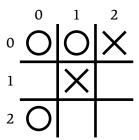

Back to Tic-Tac-Toe

- Every statement about the world was modelled as a proposition.
- But what if we want to make a statement about everyone in the world?
- Recall our Tic-Tac-Toe example.
- There was no link between P_{ij} and P_{ij}.
- Could have valuations where they were simultaneously made true.
- We wanted to say "No square simultaneously contains a and a ×"
- Had to write a long conjunctive expression, which talked about each square individually.
- What if I played on a 5 * 5 grid? Or a 27 * 27 grid? Infeasible to write such a formula!

Back to Tic-Tac-Toe: First-Order logic

- Would like P^{\bigcirc} and P^{\times} to be statements that can be made about *any* cell
- We call these **predicates**; fundamental building blocks now
- Can think of a proposition as a 0-ary predicate
- A cell is (i, j) where i is the row and j the column
- The following expression represents the grid below

 $circ(0,0) \land circ(0,1) \land cross(0,2) \land cross(1,1) \land circ(2,0)$

Back to Tic-Tac-Toe: First-Order logic

- Real power of predicates: variables and quantification
- We wanted to say "No square simultaneously contains a and a ×"
- Move to First-Order Logic (FOL)!
- It allows us to talk about **all** and/or **some** elements in the universe
- All elements: ∀ (mnemonic: upside-down A, for "all")
- **Some** element: ∃ (mnemonic: backward E, for "exists")
- "For every cell, it is not the case that the cell contains a circle as well as that the cell contains a cross."
- Notation that captures "for every cell" gives us a small expression which talks about all cells in a grid of any size!

First-Order logic: Syntax

- We need to define the objects about which one can state a predicate.
- This requires us to define a notion of **terms**.
- Have variables (atomic) and functions to build bigger terms.
- The set of FOL expressions one ends up with depends on the chosen sets of functions and predicates.
- This is called a **signature**.

First-Order logic: Syntax

- We have a countable set of variables $x, y, z \dots \in \mathcal{V}$
- We have a countable set of function symbols *f*, *g*, *h* ... ∈ 𝒯, and a countable set of relation/predicate symbols *P*, *Q*, *R* ... ∈ 𝒯
- 0-ary function symbols are constant symbols in %
- $(\mathscr{C}, \mathscr{F}, \mathscr{P})$ is a signature Σ
- Grammar for FOL is as follows

$$\varphi, \psi \coloneqq t_1 = t_2 \big| P(t_1, \dots, t_n) \big| \neg \varphi \big| \varphi \land \psi \big| \varphi \lor \psi \big| \varphi \supset \psi \big| \exists x. \ [\varphi] \ \big| \forall x. \ [\varphi]$$

where \underline{P} is an \underline{n} -ary predicate symbol in Σ , and the term syntax is

$$t \coloneqq x \in \mathcal{V} \mid c \in \mathcal{C} \mid f(t_1, \dots, t_m)$$

where f is an m-ary function symbol in Σ .

A note on quantification

- ∀: "every", "all", "each", "any"
- ∃: "some", "many", "certain", "there exists", "at least one"
- Pay attention to the negations of these!
- $\neg \forall x$. $[\varphi]$ is equivalent to $\exists x$. $[\neg \varphi]$
- $\neg \exists x$. $[\varphi]$ is equivalent to $\forall x$. $[\neg \varphi]$
- We will see how to prove these later.

Tic-Tac-Toe

- What is the signature that we need for the Tic-Tac-Toe example?
- $\Sigma = \{\mathscr{C}, \mathscr{F}, \mathscr{P}\}$, where
- Constants: $\mathscr{C} = \{0, 1, 2\}$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{\text{circ}/2, \text{cross}/2\}$
- For a bigger grid, add more constants
- $\mathscr{C} = \{0, ..., n-1\}$ for a grid of size $n \times n$.
- We might need more functions and relations too, depending on the expressions we want to write.

Express the following in FOL.

• At least one cell has a circle

Express the following in FOL.

• At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x, y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x,y)]]

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

Express the following in FOL.

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x, y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

• Win: circles line up horizontally

Express the following in FOL.

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x,y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

• Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

- Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]
- Win: circles line up vertically

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

- Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]
- Win: circles line up vertically: $\exists \nu$. $[\forall h$. $[circ(h, \nu)]]$
- Win: circles line up along the main diagonal

- At least one cell has a circle: $\exists x$. $[\exists y$. [circ(x,y)]]
- At least one cell has a cross: $\exists x$. $[\exists y$. [cross(x, y)]]
- A cell cannot simultaneously contain both a circle and a cross:

```
\forall x. \ [\forall y. \ [\neg \{ circ(x,y) \land cross(x,y) \}]]
```

- Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]
- Win: circles line up vertically: $\exists v$. $[\forall h$. [circ(h, v)]]
- Win: circles line up along the main diagonal: ∀i. [circ(i, i)]

- What about the antidiagonal?
- Needs us to talk about cells of the form (i, 2 i)
- Constants: $\mathscr{C} = \{0, 1, 2\}$
- Functions: $\mathcal{F} = \{f/1\}$, where f(x) = 2 x
- Predicates: $\mathcal{P} = \{\text{circ/2}, \text{cross/2}\}\$
- Win: circles line up along the antidiagonal

- What about the antidiagonal?
- Needs us to talk about cells of the form (i, 2 i)
- Constants: $\mathscr{C} = \{0, 1, 2\}$
- Functions: $\mathcal{F} = \{f/1\}$, where f(x) = 2 x
- Predicates: $\mathcal{P} = \{\text{circ/2}, \text{cross/2}\}\$
- Win: circles line up along the antidiagonal: ∀i. [circ(i, f(i))]
- A win for circle is a disjunction of these four FOL expressions

About quantification

- Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]
- "There is a row such that for every column, a circle appears in the corresponding cell"
- What if we inverted the quantifiers?
- What does $\forall v$. [$\exists h$. [circ(h, v)]] capture?
- "For every column, there is a row such that a circle appears in the corresponding cell"
- Would it still capture the win condition where circles line up horizontally?

About quantification

- Win: circles line up horizontally: $\exists h$. $[\forall v$. [circ(h, v)]]
- "There is a row such that for every column, a circle appears in the corresponding cell"
- What if we inverted the quantifiers?
- What does $\forall v$. [$\exists h$. [circ(h, v)]] capture?
- "For every column, there is a row such that a circle appears in the corresponding cell"
- Would it still capture the win condition where circles line up horizontally?
- Pay attention to the order of quantifiers!

- Consider a graph G = (V, E)
- Constants: $\mathscr{C} = \emptyset$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{E/2\}$
- No vertex has an edge to itself

- Consider a graph G = (V, E)
- Constants: $\mathscr{C} = \emptyset$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{E/2\}$
- No vertex has an edge to itself: $\forall u$. $[\forall v$. $[E(u, v) \supset \neg(u = v)]]$
- Every vertex is part of some edge

- Consider a graph G = (V, E)
- Constants: $\mathscr{C} = \emptyset$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{E/2\}$
- No vertex has an edge to itself: $\forall u$. $[\forall v$. $[E(u, v) \supset \neg(u = v)]]$
- Every vertex is part of some edge: $\forall u$. $[\exists v$. [E(u, v)]]
- Undirected graph

- Consider a graph G = (V, E)
- Constants: $\mathscr{C} = \emptyset$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{E/2\}$
- No vertex has an edge to itself: $\forall u$. $[\forall v$. $[E(u, v) \supset \neg(u = v)]]$
- Every vertex is part of some edge: $\forall u. [\exists v. [E(u, v)]]$
- Undirected graph: $\forall u. \ [\forall v. \ [E(u,v) \supset E(v,u)]]$
- Transitive graph (a path from u to v implies an edge between u and v)

- Consider a graph G = (V, E)
- Constants: $\mathscr{C} = \emptyset$
- Functions: $\mathcal{F} = \emptyset$
- Predicates: $\mathcal{P} = \{E/2\}$
- No vertex has an edge to itself: $\forall u. \ [\forall v. \ [E(u, v) \supset \neg(u = v)]]$
- Every vertex is part of some edge: $\forall u$. $[\exists v$. [E(u, v)]]
- Undirected graph: $\forall u. \ [\forall v. \ [E(u, v) \supset E(v, u)]]$
- Transitive graph (a path from u to v implies an edge between u and v): $\forall u$. $[\forall v$. $[\forall w$. $[(E(u, w) \land E(w, v)) \supset E(u, v)]]]$

- $\Sigma = (\emptyset, \emptyset, \{E/2, C_1/1, ..., C_k/1\})$
- Every vertex gets a colour between 1 and k

- $\Sigma = (\emptyset, \emptyset, \{E/2, C_1/1, ..., C_k/1\})$
- Every vertex gets a colour between 1 and k:

$$\forall \nu$$
. $[C_1(\nu) \lor C_2(\nu) \lor ... \lor C_k(\nu)]$

• No vertex gets more than one colour

- $\Sigma = (\emptyset, \emptyset, \{E/2, C_1/1, ..., C_k/1\})$
- Every vertex gets a colour between 1 and k:

$$\forall \nu$$
. $[C_1(\nu) \lor C_2(\nu) \lor ... \lor C_k(\nu)]$

• No vertex gets more than one colour:

$$\forall \nu. \left[\bigwedge_{1 \leq i \leq k} \left\{ C_i(\nu) \supset \bigwedge_{\substack{1 \leq j \leq k \\ j \neq i}} \neg C_j(\nu) \right\} \right]$$

· Vertices along an edge do not get the same colour

- $\Sigma = (\emptyset, \emptyset, \{E/2, C_1/1, ..., C_k/1\})$
- Every vertex gets a colour between 1 and k:

$$\forall \nu. \ [C_1(\nu) \lor C_2(\nu) \lor ... \lor C_k(\nu)]$$

• No vertex gets more than one colour:

$$\forall \nu. \left[\bigwedge_{1 \leqslant i \leqslant k} \left\{ C_i(\nu) \supset \bigwedge_{\substack{1 \leqslant j \leqslant k \\ j \neq i}} \neg C_j(\nu) \right\} \right]$$

Vertices along an edge do not get the same colour:

$$\forall u. \left[\forall v. \left[E(u, v) \supset \bigwedge_{1 \leqslant i \leqslant k} \neg \{ C_i(u) \land C_i(v) \} \right] \right]$$
